                                                                 involved in plant resistance or response to pathogenic infection. Mi comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an unlinfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to derivatives of murine and human pentraxin.3 (PTX3) (shown in ABG75068-ABG75073). These sequences, and biotinylated derivatives of PTX3, are used to make autologous vaccines, based on inactivated tumour cells, to treat solid or haematological tumours. The present sequence is a derivative of the murine PTX3 cDNA shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          256 rccargadadecracidadecracadadecracadadecracadadecracadadeca

                                                                                                                                                                                                                                                                                   New derivatives of human or murine pentraxin-3, useful for preparing autologous vaccines for treating tumors, also new nucleic acid encoding
                                                                                                                                                                                                                                                                                                                                                    The present invention relates to derivatives of murine and human pentraxin-3 (PTX3) (shown in ABG75068-ABG75073). These sequences, and biotinylated derivatives of PTX3, are used to make autologous vaccines, based on inactivated tumour cells, to treat solid or haematological tumours. The present sequence is a derivative of the murine PTX3 cDNA shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                      (PTX3) for preparing a medicament for increasing the reproductive ability in a female subject, used as an antiinfertility drug. The virals or plasmid vectors containing the human PTX3 cDNA are useful for treating female subjects in need of increasing the reproductive ability. The PTX3 protein is useful as a diagnostic marker of the reproductive ability in human female, and PTX3 is useful as a target protein for the screening of pharmaceutical compounds to assess their capability to affect the reproductive ability in a female subject. The present sequence represents mouse PTX3 nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             341 recerceadadecrecadedecrecadedadecrecadedecederecededecededaded 400

                                                                                                                                                                                                                                                                                                              (PTX3) for preparing a medicament for increasing the reproductive ability in a female subject, used as an antiinfertility drug. The virals or plasmid vectors containing the human PTX3 cDNA are useful for treating female subjects in need of increasing the reproductive ability. The PTX3 protein is useful as a diagnostic marker of the reproductive ability in human female, and PTX3 is useful as a target protein for the screening of pharmaceutical compounds to assess their capability to affect the reproductive ability in a female subject. The present sequence represents

This sequence encodes the Brevibacterium lactofermentum pSFK6 protein.

The invention relates to a plasmid containing a temperature sensitive replication control region (TSRCR) and a marker gene (MG). The TSRCR is derived from plasmid pAM30 harboured by Brevibacterium lactofermentum (ATCC 13869) and allows the plasmid to replicate autonomously at a low temperature but does not allow the plasmid to replicate autonomously at a low temperature but does not allow the plasmid to replicate autonomously at an elevated temperature in coryneform bacterium which may be used for medifying a chromosomal gene in a coryneform bacterium, which may be used for the promoterion of useful substances, such as amino acids, by fermentation, to change their genetic traits. Therefore, the plasmid can be used for breeding microorganisms for the production of amino acids by fermentation. The plasmid comprises a TSRCR that allows the plasmid to replicate autonomously at an elevated temperature in coryneform bacteria within a temperature range in which the bacteria can grow. (Updated on 15 SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1795 AACGGTTGGCACTTGCACGGCAACATGCTGTTCTTGGATCGTCCACTGTCTGACGAT 1854

```
introprecion relates to a plasmid containing a temperature sensitive replication control region (TSRCR) and a marker gene (WG). The TSRCR is derived from plasmid pAM330 harboured by Brevibacterium lactofermentum (ATCC 13869) and allows the plasmid to replicate autonomously at a low temperature but does not allow the plasmid to replicate autonomously at a low temperature but does not allow materia within a temperature range in which the bacteria can grow. The plasmid can be used for modifying a chromosomal gene in a coryneform bacterium, which may be used for the production of useful substances, such as amino acids, by fermentation, to change their genetic traits. Therefore, the plasmid can be used for breeding microorganisms for the production of amino acids by fermentation. The plasmid comprises a TSRCR that allows the plasmid to replicate autonomously at an elevated temperature in coryneform bacteria within a temperature range in which the bacteria can grow. The present invention describes a method for transforming a high temperature-resistant coryneform microbe in which the high temperature-resistant coryneform microbe in which the high temperature-resistant coryneform microbe and an electric pulse is applied to a solution containing the microbe having a changed structure of cell wall of a microbe having a changed structure of cell wall cresistant coryneform microbe in which the cell wall of a high temperature-resistant coryneform microbe is weakened and electric pulse is applied to a solution containing the microbe having weakened cell wall and a DNA; to a solution containing the microbe having weakened cell wall and a DNA; to a solution containing the microbe having weakened cell wall and a DNA; to a solution containing the microbe carrying both a plasmid vector temperature-resistant coryneform microbe in which a recombinant DNA is introduced, and (3) a transformant of a high temperature-resistant coryneform microbe and coryneforming a high temperature-resistant coryneform coryneform coryneform microbe. The present sequence encodes a Brevibacterium actober microbe. The present sequence microdes a sample from the present invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1855 GAACTCAAGGCATTTGAGGATTCCATGTTTTCCCGCTGGTCTGCTGTGTTTAAGGCC 1914

The present invention describes a method for transforming a high temperature-resistant coryneform microbe in which the high temperature-resistant coryneform microbe and an electric pulse is applied to structure of cell wall of the microbe and an electric pulse is applied to a solution containing the microbe and an electric pulse is applied to a solution containing the microbe having a changed structure of cell wall coryneform microbe in which the cell wall of a high temperature resistant coryneform microbe is wakened and electric pulse is applied to a solution containing the microbe having weakened cell wall and a DNA; (2) a transformant of a high temperature-resistant coryneform microbe in which a recombinant DNA is introduced; and (3) a transformant of a high temperature-resistant coryneform microbe in which a recombinant DNA is introduced; and (3) a transformant of a high temperature-resistant coryneform microbe and coryneform microbe and coryneform microbe and a plasmid vector derived from Coryneform microbe and so plasmid vector derived from Coryneform microbe. The present sequence encodes a serious example from the present invention. (Updated on 29-AUG-2003 to a standardise OS field)
                                                                                                                                                            Brevibacterium lactofermentum pSFK6 nucleotide sequence SEQ ID NO:5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transformation of high temperature-resistant coryneform microbe and

Patent No. 5756677
GENERAL INFORMATION:
APPLICANT: Lewis, Randolph V.
APPLICANT: Colgin, Mark
ITILE OF INVENTION: cDNAs Encoding Minor Ampullate Spider
ITILE OF INVENTION: Silk Proteins
NUMBER OF SEQUENCES: 56
CORRESPONDENCE ADDRESS:
ADDRESSEE BIrch, Stewart, Kolasch & Birch
STREET: P.O. Box 747
CITY: Falls Church
STREET: Virginia
STAME: Virginia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2.9%; Score 32.8; DB 1; Length 2793;

New nucleic acid molecule encoding replication protein/plasmid stability protein, useful in cloning and expression vectors, particularly shuttle vectors for expression of heterologous genes in Rhodococcus species.

Claim 4; Page 64-65; 96pp; English.

This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isopremoid molecules, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile hydrateases, ethylene forming enzyme, pyruvate decarboxylase, alcohol dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      354
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of isoprenoid molecules, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile dehydraceases, ethylene forming enzyme, pyruvate decarboxylase, alochol dehydraceases, terpene synthases, and cholesterol oxidase in an Actinomyceases bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents A. pyogenes pAPI replication protein described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VG-GDPQALELWREFEFGSMGRRAIAWSRGLRARAGLGAELTDAQIVEQEESAPVMVAII 325

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15;
                                                                                                                                                                                                                                                      This sequence is encoded by the essential region gene from plasmid pNBb1 used in the vector of the invention. The vector is a shuttle vector for a Bifidobacterium, and contains: (a) a replicated essential region originated from a plasmid pNBb1 of Bifidobacterium breve ATCC 15698; (b) a replicated essential region originated from a plasmid of E. coli; and (c) an antibiotic-resistant gene originated from a plasmid of E. coli and an antibiotic-resistant gene functioning by a Bifidobacterium. The shuttle vector can be used to transform various Bifidobacteria species
                                                                                                                                         Shuttle vector for a Bifidobacterium species - contains specific elements from existing plasmids e.g. pNBb1 of ATCC 15698.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AMFDRWTS--KLVSLGF-----AAPLRNSGGLDVR-KIGGEADQVLAAYLTKIASG 239

This sequence is the Brevibacterium lactofermentum p48K protein. The invention relates to a plasmid containing a temperature sensitive caplication control region (FSRCR) and a marker gene (MG). The TSRCR is derived from plasmid pAM30 harboured by Brevibacterium lactofermentum (ATCC 13869) and allows the plasmid to replicate autonomously at a low temperature but does not allow the plasmid to replicate autonomously at an elevated temperature in coryneform bacteria within a temperature range in which the bacteria can grow. The plasmid can be used for the chromosomal gene in a coryneform bacterium, which may be used for the production of useful substances, such as amino acids, by fermentation, to change their genetic traits. Therefore, the plasmid can be used for breading microorganisms for the production of amino acids by fermentation. The plasmid comprises a TSRCR that allows the plasmid to replicate autonomously at an elevated temperature in coryneform bacteria within a temperature range in which the bacteria can grow. The present invention describes a method for transforming a high temperature-resistant coryneform microbe in which the high temperature-resistant coryneform microbe and an electric pulse is applied to structure of cell wall of the microbe and an electric pulse is applied to a solution containing the microbe having a changed structure of cell wall of a middle microbe in which the cell wall of a high temperature-resistant coryneform microbe in which the cell wall of a high temperature resistant coryneform microbe having weakened cell wall and a DNA; (2) a transformant of a high temperature-resistant coryneform microbe having weakened cell wall and a DNA; (2) a transformant of a high temperature-resistant coryneform microbe and (3) a transformant of a high temperature-resistant coryneform microbe and coryneform microbe in which a recombinant DNA is introduced; and (3) a transformant of a high temperature- resistant coryneform microbe and a chieved from the high temperature- resistant coryneform microbe and a chievefermentum. The method is used for transforming a high temperature-coryneform microbe. The present sequence represents a Brevibacterium lactofermentum pSFK6 protein sequence, which is used in an example from the present invention. (Updated on 29-AUG-2003 to

The present invention relates to Coryneform bacterium in which the arginine repressor does not function normally and which produces Larginine. Coryneform bacterium is used to produce L-arginine which is useful in agents for promoting liver function and in amino acid infusions or in 'comprehensive' amino acid pharmaceutical. Coryneform bacterium accumulate L-arginine to higher levels than wild-type strains, e.g. 120 compared with 20, mg/dl. The present sequence is Brevibacterium lactofermentum pSFK6 replication control region protein. The replication control region bNA is used in the construction of fauttle vector for Escherichia coli and Coryneform bacteria and temperature sensitive vector. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              145

                                                                                                                                        This invention describes a novel nucleic acid encoding a replication protein or a plasmid stability protein. The product of the invention is useful for expression of nucleic acid such as genes encoding enzymes involved in the production of septembolical enclass, polyhydroxyalkanoic acid (PHA) synthases, carotenoid biosynthesis enzymes, nitrile hydrateses, ethylene forming enzyme, pyruvate decarboxylase, alchol dehydrogenase, terpene synthases, and cholesterol oxidase in an Actinomycetales bacteria. The replication protein or plasmid stability protein are useful in cloning and expression vectors and particularly in shuttle vectors for the expression of homologous and heterologous genes in Rhodococcus sp. This sequence represents the S. nigrificans pSN22 replication protein described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Plasmid stability protein; replication protein; ethylene forming enzyme; cardrenoid biosynthesis enzyme; isoprenoid; pyruvate decarboxylase; polyhydroxyalkanoic acid synthase; PHA synthase; nitrile hydratase; alcohol dehydrogenase; terpene synthase; cholesterol oxidase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule encoding replication protein/plasmid stability protein, useful in cloning and expression vectors, particularly shuttle vectors for expression of heterologous genes in Rhodococcus species.

This sequence is the Brevibacterium lactofermentum pSFK6 protein. The invention relates to a plasmid containing a temperature sensitive invention control region (TSRCR) and a marker gene (MG). The TSRCR is derived from plasmid pAM330 harboured by Brevibacterium lactofermentum (ATCC 13869) and allows the plasmid to replicate autonomously at a low temperature but does not allow the plasmid to replicate autonomously at an elevated temperature in corpneform bacteria within a temperature range in which the bacteria can grow. The plasmid can be used for modifying a chromosomal gene in a coryneform bacterium, which may be used for the

production of useful substances, such as amino acids, by fermentation, to change their genetic traits. Therefore, the plasmid can be used for breading microorganisms for the production of amino acids by fermentation. The plasmid comprises a TSRCR that allows the plasmid to replicate autonomously at an elevated temperature in coryneform bacteria within a temperature range in which the bacteria can grow. temperature-resistant corputation microbe in which the high temperature-resistant corputation microbe in which the high temperature resistant corpue is treated with a chemical changing the structure of cell wall of the microbe and an electric pulse is applied to a solution containing the microbe having a changed structure of cell wall cesistant corpreform microbe in which the cell wall of a high temperature-resistant corpreform microbe is wackened and electric pulse is applied to a solution containing the microbe having weakened cell wall and a DNA; cc (2) a transformant of a high temperature-resistant corpueform microbe in which a recombinant DNA is introduced; and (3) a transformant of a high temperature-resistant corpueform microbe of compinant DNA is introduced; and (3) a transformant of a high temperature-resistant corpueform microbe and a plasmid vector derived from Corpuedacterium glutamicum or Brevibacterium clarcofermentum. The method is used for transforming a high temperature-resistant corpueform microbe. The present sequence represents a lactofermentum lactofermentum p48K protein sequence represents a sample from the present invention. (Updated on 29-AUG-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠ
                                                                                                                                                                                                                                                                                      The present invention relates to Coryneform bacterium in which the arginine repressor does not function normally and which produces Larginine. Coryneform bacterium is used to produce Larginine which is useful in agents for promoting liver function and in amino acid infusions or in 'comprehensive' amino acid pharmaceutical. Coryneform bacterium accumulate Larginine to higher levels than wild-type strains, e.g. 120 compared with 20, mg/dl. The present sequence is Brevibacterium lactofermentum p48K replication control region protein. The replication control region protein and coryneform bacteria and temperature sensitive vector. The microorganism is also modified so that an arginine repressor (argR) does not function normally. The method of the invention is useful for the promoting agents, amino acid infusion and comprehensive amino acid pharmaceuticals. The present sequence represents the protein encoded by the Erevibacterium lactofermentum ORF in plasmid pSFKG. Note: The present sequence is given as SEQ ID No:7 in the Sequence Listing but is referred to as SEQ ID No:6 in the rest of the specification.
                                                                                                                                                                                                                                                                                                                                                                                      A microorganism comprising enhanced expression of the lysE gene is useful for enhanced production of L-arginine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            145
